1/45

Lists: Constructors, Selectors, Operations

- · Basics of construction, selection
 - cons, list, list-ref, list-head, list-tail
- Operations
 - Combining: reverse, append
 - Process elements: map, filter, fold-right, fold-left, sort
- · Abstraction: ... just use Scheme's

2/45

Selectors: Beyond car, cdr

```
> (define ex '(a b c d e f))
> (list-ref ex 3)
d
> (list-tail ex 3)
(d e f)
> (list-tail ex 0)
(a b c d e f)
> (list-head ex 3)
(a b c)
```

3/45

Selectors: Beyond car, cdr

4/45

Selectors: Beyond car, cdr

Selectors: Beyond car, cdr

1

List-head! > (define ex '(a b c d e f)) > (list-head! ex 0) () > ex (a b c d e f) > (list-head! ex 2) (a b) > ex (a b)

Append

```
(define (append a b) T(n) = \Theta(n) (if (null? a) S(n) = \Theta(n) (cons (car a) (append (cdr a) b))))
```

- · Append copies first list
- Note on resources:
 - S measures space used by deferred operations, but not by list structure!

9/45

Append!

```
> (define a '(1 2))
> (define b '(3 4))
> (append! a b)
(1 2 3 4)
> a
(1 2 3 4)
> b
(3 4)
```

10/45

Reverse $\begin{array}{c} \text{(define (reverse0 1st)} & T(n) = \Theta(n^2) \\ \text{(if (null? 1st)} & S(n) = \Theta(n) \\ \text{(append (reverse0 (cdr 1st))} & S(n) = \Theta(n) \\ \text{(list (car 1st))))} \\ \text{Substitution model:} & \\ \text{(reverse0 '(1 2 3))} & \text{(append (reverse0 '(2 3)) (list 1))} & \text{(append (append (reverse0 '(3)) (list 2)) (list 1))} & \\ \text{(append (append (append (reverse0 '())) (list 3))} & \\ \text{(list 1))} \\ \end{array}$

Reverse (better)

```
 \begin{array}{lll} (\text{define (reverse lst)} \\ (\text{define (iter 1 ans)} \\ (\text{if (null r 1)} \\ & \text{ans} \\ & (\text{iter (cdr 1) (cons (car 1) ans))))} & S(n) = \Theta(1) \\ \\ (\text{iter (st '()))} \\ (\text{define ex '(1 2 3))} \\ (\text{reverse ex)} \\ (\text{iter (1 2 3) '())} \\ (\text{iter (2 3) (1))} \\ (\text{iter (3) (2 1))} \\ (\text{iter () (3 2 1)} \\ \end{array}
```

 Lists "come apart" from the front, but "build up" from the back: use this.

13/4

```
Reverse!
   (define (reverse! lst)
                                                         T(n) = \Theta(n)
     (define (iter last current)
       (if (null? current)
                                                         S(n) = \Theta(1)
            last
            (let ((next (cdr current)))
              (set-cdr! current last)
(iter current next))))
     (iter '() lst))
()
                                                                \overline{\cdot}
              \cdot \nearrow
                              •
                                               • •
                                                                • •
```

Two map's & filter

```
T(n) = \Theta(n)
(define (map0 f lst)
  (if (null? lst)
                                                      S(n) = \Theta(n)
       '()
      (cons (f (car lst))
             (map0 f (cdr lst)))))
                                                      T(n) = \Theta(n)
(define (map f lst)
(define (iter 1 ans)
                                                      S(n) = \Theta(1)
    (if (null? 1)
         (reverse! ans)
 (iter (cdr 1) (cons (f (car 1)) ans))))
(iter lst '()))
                                                      T(n) = \Theta(n)
(define (filter f lst)
  (cond ((null? lst) '())
                                                      S(n) = \Theta(n)
         ((f (car lst))
          (cons (car lst) (filter f (cdr lst))))
         (else (filter f (cdr lst)))))
                                                                15/45
```

Fold Operations

Sorting a list

- 1. Split in half
- 2. Sort each half
- 3. Merge the halves
 - Merge two sorted lists into one
 - Take advantage of the fact they are sorted

(4 1 7 9 4 2 11 5) (4 1 7 9)(4 2 11 5) (1 4 7 9)(2 4 5 11) (1 2 4 4 5 7 9 11)

19/45

Merge

Sorting a list

- 1. Split in half
- 2. Sort each half
- 3. Merge the halves

```
    (4 1 7 9 4 2 11 5)

    (4 1 7 9)
    (4 2 11 5)

    (4 1)
    (7 9)

    (4)
    (1)

    (1 4)
    (7)(9)

    (1 4 7 9)
    (4 2)(11 5)
```

Sort

Of course, (define (mergel x y less?) there is (let ((arcot (cons *() x))) (yrcot (cons *() y))) merge! (define (lter ans) (cond ((and (mull? (cdr xrcot))) man)

```
(define (ter ans)
  (cond ((land (null? (cdr xroot)) (null? (cdr yroot)))
    ans)
    ((null? (cdr xroot))
    (append1 (reverse! (cdr yroot)) ans))
    ((null? (cdr yroot))
    (append1 (reverse! (cdr xroot)) ans))
    ((less? (cadr xroot) (cadr yroot))
    (let ((current (cdr xroot)))
        (set-cdr! xroot (cadr yroot))
        (set-cdr! current ans)
        (iter current)))
    (else
    (let ((current (cdr yroot)))
        (set-cdr! yroot (cdr current))
        (set-cdr! current ans)
        (iter current)))
    (cond ((null? x y))
    ((null? y x)
    (else (reverse! (iter '()))))))
```

23/45

... and sort! and halve!

22/45

Sort of final word on sort

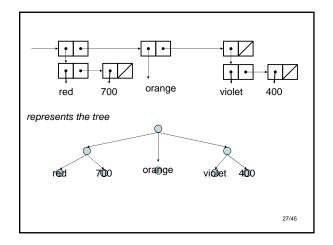

- Finding midpoint of list is expensive, and we keep having to do it
- Instead, nibble away from left
 - Pick off first two sublists of length 1 each
 - Merge them to get a sorted list of length 2
 - Pick off another sublist of length 2, sort it, then merge with previous ==> length 4
 - ...
 - Pick off another sublist of length 2ⁿ, sort, then merge with prev ==> length 2ⁿ⁺¹

25/45

Trees

- Abstract Data Type for trees
 - -Tree<C> = Leaf<C> | List<Tree<C>>
 - -Leaf<C>=C
 - -Note: C had best not be a list

```
(define (leaf? obj) (not (pair? obj)) ;; () can be a leaf
(define (leaf? obj) (not (list? obj)) ;; () is the empty tree
```

Counting leaves

28/45

General operations on trees

Using tree-map and tree-fold

```
(define (tree-fold leaf-op combiner init tree)
  (if (leaf? tree)
      (leaf-op tree)
      (fold-right
      combiner
      init
      (map (lambda (e) (tree-fold leaf-op combiner init e))
            tree))))
> (tree-fold (lambda (x) 1) + 0 tr)
4
```

subst in terms of tree-fold

5

Huffman Coding

- If some symbols in an alphabet are more frequently used than others, we can compress messages
- ASCII uses 7 or 8 bits/char (128 or 256)
- In English, "e" is far more common than "z", which in turn is far more common than Ctl-K (vertical tab(?))
- Huffman: use shorter bit-strings to encode most common characters
 - Prefix codes: no two codes share same prefix

32/45

Making a Huffman Code

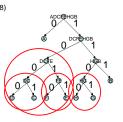

- Start with a list of symbol/frequency nodes, sorted in order of increasing freq
- Merge the first two into a new node. It will represent the union of the symbols and sum of frequencies; sort it back into the list
- · Repeat until there is only one node

33/45

Example of building a Huffman Tree

(H 1) (G 1) (F 1) (E 1) (D 1) (C 1) (B 3) (A 8) (F 1) (E 1) (D 1) (C 1) ((H G) 2) (B 3) (A 8) (D 1) (C 1) ((H F) 2) ((H G) 2) (B 3) (A 8) (D 1) (C 1) ((F E) 2) ((H G) 2) (B 3) (A 8) ((H G) 2) (E 3) ((A B) ((H G) 2) (B 3) ((A B) ((H G) 2) (B 3) ((D C F E) 4) (A 8) ((D C F E) 4) ((H G) 5) (A 8) ((A B) ((D C F E H G B) 9) ((A D C F E H G B) 17)

Leaf holds symbol & weight

35/45

Code tree

36/45

Building the Huffman Tree

Our training sample

(define text1 "The algorithm for generating a Huffman tree is very simple. The idea is to arrange the tree so that the symbols with the lowest frequency appear farthest away from the root. Begin with the set of leaf nodes, containing symbols and their frequencies, as determined by the initial data from which the code is to be constructed. Now find two leaves with the lowest weights and merge them to produce a node that has these two nodes as its left and right branches. The weight of the new node is the sum of the two weights. Remove the two leaves from the original set and replace them by this new node. Now continue this process. At each step, merge two nodes with the smallest weights, removing them from the set and replacing them with a node that has these two as its left and right branches. The process stops when there is only one node left, which is the root of the entire tree.")

38/45

40/45

Statistics

 $((leaf \mid H \mid 1) \; (leaf \mid B \mid 1) \; (leaf \mid R \mid 1) \; (leaf \mid A \mid 1) \; (leaf \mid q \; 2) \; (leaf \mid N \mid 2) \; (leaf \mid T \mid 4) \; (leaf v \; 5) \; (leaf \mid , \mid 5) \; (leaf u \; 7) \; (leaf b \; 7) \; (leaf y \; 8) \; (leaf \mid , \mid 9) \; (leaf p \; 10) \; (leaf g \; 77) \; (leaf c \; 17) \; (leaf 1 \; 19) \; (leaf f \; 19) \; (leaf m \; 20) \; (leaf d \; 22) \; (leaf w \; 25) \; (leaf r \; 37) \; (leaf n \; 41) \; (leaf a \; 22) \; (leaf i \; 43) \; (leaf o \; 51) \; (leaf s \; 51) \; (leaf h \; 57) \; (leaf t \; 84) \; (leaf e \; 109) \; (leaf \mid \mid 170))$

39/45

The tree

```
(((leaf | | 170)

((((leaf m 20) (leaf d 22) (m d) 42) (leaf i 43) (m d i) 85)

((leaf c 51) (leaf s 51) (o s) 102)

(m d i o s)

187)

(| | m d i o s)

357)

(((leaf e 109)

(((leaf w 25)

(((leaf | 7) (leaf y 8) (b y) 15)

(| | u b y)

27)

(w | , | u b y)

52)

(leaf h 57)

(w | , | u b y h)

109)

(e w | , | u b y h)

218) ...
```

How efficient?

- Our sample text has 887 characters, or 7096 bits in ASCII.
- Our generated Huffman code encodes it in 3648 bits, ≈51% (4.1 bits/char)
- Because code is built from this very text, it's as good as it gets!
- LZW (Lempel-Zip-Welch) is most common, gets ≈50% on English.

41/45

Summary

- Lists: standard and mutating operators...
- · Sort & merge
- Trees
- · Compression via Huffman coding
- The organization of the code reflects the organization of the data it operates on.

42/45

Happy Spring Break!

43/45
